Jefferson Lague Adeline Faye Lompon IT64 (IT36A)

Introduction

The React and Ionic frameworks were used to create the straightforward ToDo list application that was produced. In addition to providing sign-up, login, and logout options for user authentication, users can add, amend, and remove ToDo items. User management and data storage are handled via Firebase Authentication and Firestore.

Features

User Authentication:

- Sign Up: Users can register for an account by providing their name, email, and password.
- Login: Users can log in to their accounts using their email and password.
- Logout: Users can log out of their accounts.

Description of Your Works (Systems)

Login System (Login.tsx):

- Provides a login interface where users can input their email and password.
- Authenticates users using Firebase Authentication.
- Checks if the user exists in Firestore, and redirects to the home page upon successful login.

Sign-Up System (SignUp.tsx):

- Provides a sign-up interface where users can register by providing their name, email, and password.
- Validates user inputs and displays appropriate error messages.
- Stores user data in Firestore upon successful sign-up.

ToDo List Management System (ToDoList.tsx):

- Displays a list of ToDo items fetched from Firestore.
- Allows users to add new ToDo items.
- Allows users to edit existing ToDo items.
- Allows users to delete ToDo items.
- Provides a logout button to allow users to log out of their accounts.

Conceptual Framework

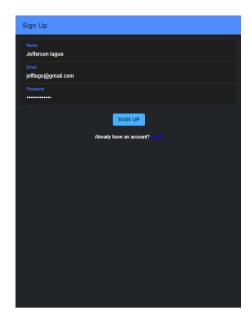

The application is designed with a client-server architecture. React and Ionic are used to build the client-side, and Firebase services (Authentication and Firestore) handle server-side functions like data storage and authentication. To complete CRUD operations on ToDo items and authentication tasks, the client and server communicate.
